## 1. R-4.1

**Statement** Describe a recursive algorithm for finding the maximum element in a sequence,  $S$ , of  $n$  elements. What is your running time and space usage?

**Solution** Both running time and space usage are  $O(n)$

---

**Algorithm 1:** Recursive algorithm for finding maximum

---

```
1 function findMax ( $S, n$ );  
   Input : Array of numbers,  $n$   
   Output: Maximum value from 0 to  $n$  in the array  $S$   
2 if  $n == 1$  then  
3   | return  $S[n - 1]$ ;  
4 end  
5  $currentMax \leftarrow findMax(S, n - 1)$ ;  
6 if  $currentMax > S[n - 1]$  then  
7   | return  $currentMax$ ;  
8 else  
9   | return  $S[n - 1]$ ;  
10 end
```

---

## 2. R-4.2

**Statement** Describe a recursive algorithm for finding the maximum element in a sequence,  $S$ , of  $n$  elements. What is your running time and space usage?

**Solution** Picture

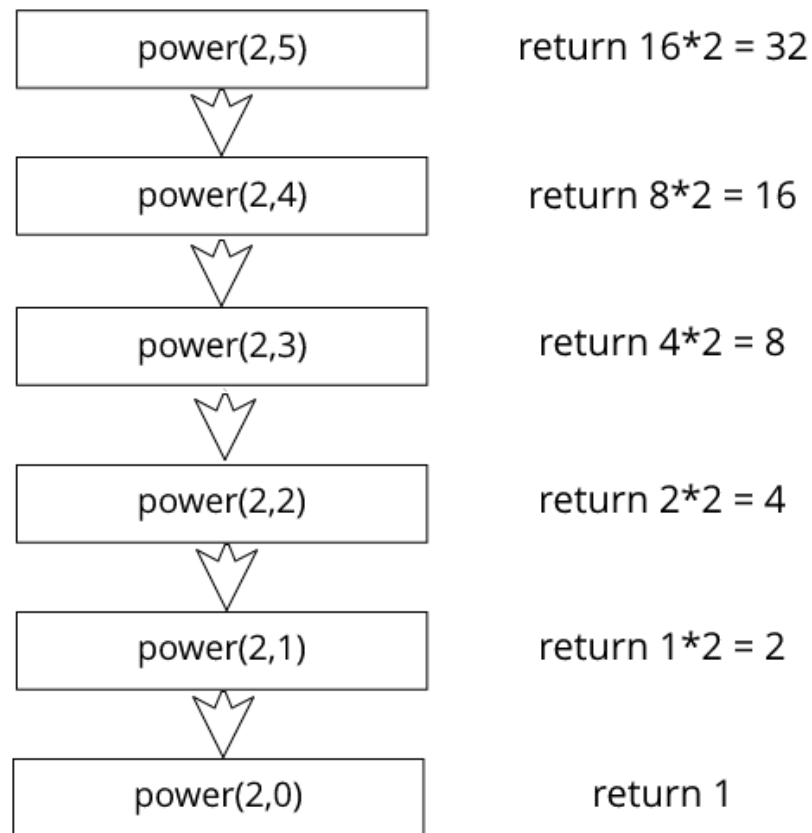

Figure 1: Power(2,5) of Code Fragment 4.11

## 3. R-4.3

Skip because of the drawing...

## 4. R-4.4

Skip because of the drawing...

## 5. R-4.5

Skip because of the drawing...

## 6. R-4.6

**Statement** Describe a recursive function for computing the  $n^{th}$  Harmonic number  $H_n = \sum_{i=1}^n \frac{1}{i}$ .

**Solution** Pseudocode

---

**Algorithm 2:** Compute the n-th Harmonic number

---

```
1 function harmonicNumber (n);  
   Input : Index n  
   Output: The n-th value in Harmonic Number  
2 if n == 1 then  
3   | return 1;  
4 end  
5 return  $\frac{1}{n} + \text{harmonicNumber}(n - 1)$ ;
```

---

## 7. R-4.7

**Statement** Describe a recursive function for converting a string of digits into the integer it represents. For example, 13531 represents the integer 13,531.

**Solution** Pseudocode

---

**Algorithm 3:** Convert a string of digits into the integer it represents

---

```
1 function toInt (string, i);  
   Input : String of digits, current index  
   Output: Number of the string represents until character i  
2 if i == 1 then return  $\text{int}(\text{string}[i])$  ;  
3 if i == 0 then return;  
4 return  $\text{toInt}(\text{string}, i - 1) * 10 + \text{int}(\text{string}[i])$ ;
```

---

## 8. R-4.8

**Statement** Isabel has an interesting way of summing up the values in a sequence  $A$  of  $n$  integers, where  $n$  is a power of two. She creates a new sequence  $B$  of half the size of  $A$  and sets  $B[i] = A[2i] + A[2i + 1]$ , for  $i = 0, 1, \dots, (n/2) - 1$ . If  $B$  has size 1, then she outputs  $B[0]$ . Otherwise, she replaces  $A$  with  $B$ , and repeats the process. What is the running time of her algorithm?

**Solution** **Total Running time:**  $O(n)$

There're total of  $\log_2 n$  recursive calls. But in the first run, this algorithm has already had to make  $n/2 = O(n)$  sums, that also the cost for creating sequence  $B$  or re-set  $A = B$ .

## 9. C-4.13

**Statement** In Section 4.2 we prove by induction that the number of lines printed by a call to `draw_interval(c)` is  $2^c - 1$ . Another interesting question is how many dashes are printed during that process. Prove by induction that the number of dashes printed by `draw_interval(c)` is  $2^{c+1} - c - 2$ .

**Solution**  $P(c)$ : The number of dashes printed by `draw_interval(c)` is  $2^{c+1} - c - 2$ .

**Base case:**  $P(1)$ : 1 dash is drawn. Correct.

**Inductive step:** Assume  $P(n)$  is True. Prove  $P(n+1)$  true.

`draw_interval(n+1)` will call `draw_interval` 2 times and `draw_line(n+1)` 1 time.

For each `draw_interval(n)`:  $2^{n+1} - n - 2$  dashes is drawn.

For `draw_line(n+1)`:  $n + 1$  dashes is drawn.

Total:  $2^{n+1} - n - 2 + 2^{n+1} - n - 2 + n + 1 = 2^{c+2} - c - 3$ .  $P(n+1)$  holds.

**Proved.**
